G1 CLIMBING + FITNESS · PERSONAL TRAINING

First-Session Assessment

Trainer use. A NASM-informed starting point for programming, not a medical exam or diagnosis.

SAMPLE · DRAFT V0.1
Pending G1 management approval

Client: Casey Sample | Date: 09/08/2026 | Session length (min): 60

Trainer: Taylor Trainer (sample)

Scope. Personal trainers observe movement to plan exercise. We don't diagnose, treat or rehabilitate injuries. Describe what you see in plain words (for example "left shoulder sits higher"), and refer out when something is outside our scope. Bodies differ: adapt or skip any screen that doesn't suit the client, and treat differences as information, not faults. Keep nutrition advice general, and suggest a qualified professional for medical or eating concerns.

1 · BEFORE WE START

- [x] Intake reviewed with the client
- [ ] Waiver and policies on file (per G1 process)
- [x] Client knows they can skip or stop anything
- [ ] Any "prefer to discuss" answers talked through privately
- [x] Goals confirmed in the client's own words
- [x] Explained what today is, and isn't
- [x] Hands-on adjustment preference checked

PLACEHOLDER: G1 process for waiver on file, incident reporting, emergency action plan (first aid, AED) and medical-clearance requirements. Pending G1 management approval.

2 · TODAY'S CHECK-IN

Energy today (1 low, 5 high)	Sleep last night (hrs)	Pain right now (0 none, 10 worst)	Where?
4	6.5	0	none

Anything changed since the intake form?

Nothing new

Plan for today (decision criteria: pending G1 management approval)

(●) Proceed as planned ( ) Proceed with modifications ( ) Pause and suggest a healthcare check-in

Stop and refer. If a client has chest pain or pressure, faints, or has severe dizziness or trouble breathing: stop, stay with them and follow G1's emergency action plan **[placeholder: pending G1 approval]**. For anything else here (unusual shortness of breath, sudden sharp or radiating pain, new numbness or tingling, a joint that feels unstable after an injury, or pain that stops a test): pause, describe what you saw, and suggest they speak with a licensed healthcare professional. Don't diagnose or guess. Note what happened per G1's incident process **[placeholder: pending G1 approval]**.

3 · RESTING MEASURES (optional; record only what helps the client's goals)

Resting heart rate (bpm)	Blood pressure (if G1 policy allows)	Height	Weight (only if the client wants it)
68			

PLACEHOLDER: G1 policy on resting heart rate, blood pressure and body measurements: who may take them, any thresholds, and how results are recorded.

4 · POSTURE SNAPSHOT (optional, standing; describe, don't label)

CHECKPOINT	WHAT I SEE (FRONT, SIDE, BACK)
Feet and ankles	Feet turn out slightly, right more than left
Knees	Level, no obvious difference side to side
Hips and low back	Pelvis looks slightly tipped forward from the side
Shoulders	Both sit slightly forward; right a little higher
Head and neck	Head sits slightly forward of the shoulders

SAMPLE · FICTIONAL CLIENT

Client: Casey Sample

Observe, don't diagnose. These screens show how the client moved today, in these shoes, with these instructions. Use them to choose a starting point and to re-check later. Stop any test that causes pain.

A · Overhead squat 5 slow reps, feet shoulder-width, toes forward, arms overhead. Watch from the front, side and back.

Front: feet and knees	☐ Feet turn out ☑ Knees move inward ☐ Knees move outward
Side: heels, hips and low back	☐ Heels rise ☐ Excessive forward lean ☐ Low back arches ☐ Low back rounds or tucks under
Side: shoulders	☑ Arms fall forward
Back: feet and hips	☐ Feet flatten ☐ Weight shifts to one side
Retests (optional)	☑ Heels raised: pattern improved ☐ Hands on hips: low-back arch improved
Overall	○ Smooth ◉ Small differences ○ Clear differences ○ Stopped (pain or limit)
Depth	◉ Thighs about parallel ○ Limited
Pain during the squat	◉ None ○ Yes, where: _____

B · Single-leg squat Hands on hips, 5 reps each side. NASM names knee inward and forward lean; the rest are common extras.

OBSERVATION	LEFT	RIGHT
Knee moves inward	☐	☑
Knee moves outward	☐	☐
Hip hikes or drops	☐	☐
Trunk leans forward or low back arches	☐	☐
Loses balance	☐	☑
Pain or discomfort (note where below)	☐	☐

C · Pushing and pulling A push-up or standing band/cable press, then a row or band pull. Watch from the side.

Push	☐ Low back arches ☑ Shoulders rise toward ears ☐ Head moves forward
Pull	☐ Low back arches ☑ Shoulders rise toward ears ☐ Head moves forward

D · Climbing add-ons Optional G1 additions, not NASM protocols. Skip any that cause pain. No max-effort finger or hangboard testing in session one.

SIDE-BY-SIDE CHECKS	LEFT	RIGHT
Knee-to-wall distance, heel down (cm)	11	9
Seated trunk rotation limited?	☐	☑

Overhead reach (back to wall)	☐ Reaches up without arching ☑ Ribs flare or low back arches ☐ Reach is limited
Supported hang (feet on floor, 10 s or less): shoulder position only	☐ Shoulders stay set ☑ Shoulders shrug to ears ☐ Skipped (finger, wrist or elbow symptoms)

What stood out, and what the client said they felt (including any pain or discomfort, with where)

No pain in any test. Knees tracked better after one cue. Overhead position feels "stuck"; right ankle tighter. Right wrist: no pain today; no max-effort finger loading in block 1, and I'll suggest a healthcare check-in if soreness returns.

SAMPLE — FICTIONAL CLIENT

Client: Casey Sample

5 · BASELINE SNAPSHOT (optional; pick what fits; quality before quantity; stop on pain)

TEST	VERSION / SETUP	RESULT	NOTES (FORM, EFFORT 0-10)
Plank hold	Forearm plank	40 s	Steady; hips sagged near the end
Push-up (wall, incline, knees, full)	Incline (bench)	10 reps	Shoulders rose on the last 3 reps
Sit-to-stand, 30 seconds	Standard chair	14 reps	Easy, RPE 3
Easy cardio, 5 minutes	Bike, level 3	RPE 4, HR 118	Passed the talk test easily
Climbing movement (optional)	Not done today		Save for session 3

6 · WHAT I NOTICED, AND THE TRAINING FOCUS (hypotheses to test through programming, not diagnoses)

WHAT I NOTICED	STARTING EMPHASIS IDEA	PRIORITY
Knees move inward (squat, right leg)	Glute activation; ankle mobility; tracking cues	H
Arms fall forward; shrug in hang	Lat and chest length; mid-back activation; thoracic mobility	H
Shoulders rise in push and pull	Scapular control: band pull-aparts, cue "long neck"	M
Right ankle feels tighter	Calf and ankle mobility; knee-to-wall drills	M

QUICK REFERENCE: WHERE PROGRAMMING OFTEN STARTS (starting ideas, not rules; not a read on which muscles are tight or weak; check against G1's training standards)	
Feet turn out or flatten; heels rise	Calf and ankle mobility; foot and lower-leg activation; stance cues; a temporary heel lift while the ankle improves
Knees move inward	Adductor and outer-thigh length; glute activation; foot and ankle mobility; knee-tracking cues
Excessive forward lean	Calf and hip-flexor length; shin, glute and back-extensor activation
Low back arches	Hip-flexor and lat length; glute and deep-core activation; rib and pelvis cues. Hands-on-hips retest: lats or core?
Low back rounds or tucks under	Hamstring and hip mobility; glute and back-extensor activation; hip-hinge practice
Arms fall forward	Lat and chest length; mid-back and rotator-cuff activation; thoracic mobility
Shoulders rise or head moves forward (push, pull, hang)	Upper-trap and neck length; scapular control work; deep neck-flexor activation

7 · STARTING PLAN

Starting OPT phase (most new clients start in Phase 1)

(●) Phase 1 Stabilization Endurance ( ) Phase 2 Strength Endurance ( ) Other: _____

Why this phase: New to structured training; build movement quality and cc

Sessions per week: 2

Next session: Thu 09/10/2026, 6:00 pm

Homework (1-2 simple items): Glute bridge 2 × 12 and wall slides 2 × 10, most days

First progress review: 10/06/2026 (week 4)

Client's own words after today: what felt good, what worried them

Felt good, no pain. Excited about the December trip. A little worried about the right wrist.

Referral or follow-up (a suggestion only; document what you said, and never record "cleared"; invite the client to share any guidance in their own words)

(●) None needed ( ) Suggested a healthcare check-in about: _____

OPT phases: 1 Stabilization Endurance · 2 Strength Endurance · 3 Muscular Development · 4 Maximal Strength · 5 Power. This sheet is NASM-informed. It is not affiliated with or endorsed by NASM, and NASM and OPT are trademarks of the National Academy of Sports Medicine. Sources: SOURCES.md.
